

Abstract & Run of Show

Submission-ready framing and a precise 30-minute delivery plan.

THE INTELLIGENCE LAYER FOR MARS

Release 5 • 04 September 2026

Abstract

Mars settlement will not be limited only by models, robots, or data. It will be limited by whether knowledge can be converted into accountable action under delay, uncertainty, and constrained authority. This talk presents the Mars Harness: an intelligence layer that sequences specialist science, research, engineering, verification, delivery, and memory processes. Each stage emits a typed work product, passes ground-truth checks, and preserves approvals and durable state. Using MOXIE as an evidence-controlled case study, it shows how SaaS workflow patterns can be packaged as portable skills for Codex, Claude Cowork, Hermes, and Grok without claiming feature parity. The result is a practical path from AI assistance to auditable mission autonomy.

Audience outcomes

Attendees leave with a seven-function harness architecture, a staged specialist sequence, evidence classes, approval boundaries, a maturity model, and downloadable skill packs that can be adapted to current agent runtimes.

Run of show

Time	Slides	Purpose
00:00–05:00	1–4	Constraint, thesis, and capability map
05:00–12:00	5–9	Architecture, science, evidence, engineering, digital thread
12:00–17:00	10–14	Completion loop, verification, memory, Mars autonomy
17:00–25:00	15–17	MOXIE evidence → engineering → return path
25:00–28:20	18–19	Portable skills and adoption
28:20–30:00	20	Call to action and close

Demonstration cue

Open the dashboard at slide 18. Select a stage, inspect its work-product contract, then open the MOXIE packet. Emphasize that the verified demonstration facts pass while the crew-scale readiness claim remains blocked pending engineering evidence.
